1978

Principal facts for gravity stations in Flathead, Glacier, Pondera
and Teton counties, Montana

by

Dolores M. Wilson

Introduction

A gravity survey was made in parts of Flathead, Glacier, Pondera and Teton counties, Montana, to provide information on structural relationships and subsurface geology as part of geologic mapping and resource evaluation projects of the U.S. Geological Survey.

Data Collection

During the summer of 1976, 261 gravity stations were established with Worden^{1/} gravity meter E-134. The gravity stations were referenced to base stations ACIC 1204-0 at Choteau, Montana; ACIC 0508-2 at Cutbank, Montana; and ACIC 1211-0 at East Glacier, Montana, of the International Gravity Standardization Net 1971 (Defense Mapping Agency Aerospace Center, 1974). Secondary base stations were established at Browning, Montana, at the Bear Creek guest ranch west of Marias Pass, and at the Bella Vista Motel in Choteau, Montana. The base station at Browning is located at spot elevation 4362 on the U.S.G.S. 1:24,000 topographic map of Browning, Montana. The elevation is at the intersection where U.S. highway 89 turns west and is northeast of the bend in the highway taken by through traffic. The Browning base station was tied to the bases at Cutbank and East Glacier. The base station designated BEARBASE is located on the northeast corner of the U.S. highway 89 bridge over Bear Creek at the entrance to the Bear

1/ Use of brand names in this report is for descriptive purposes only and in no way constitutes endorsement by the U.S. Geological Survey.

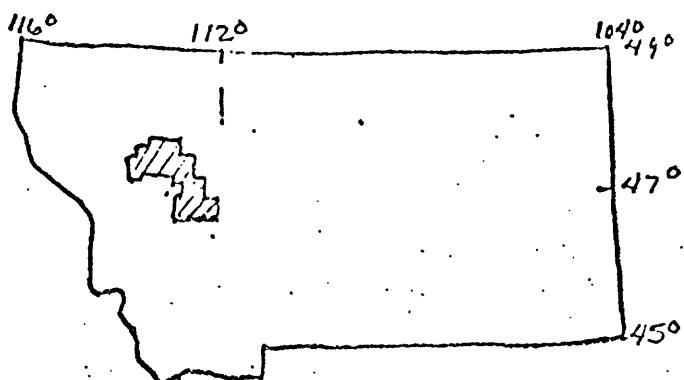

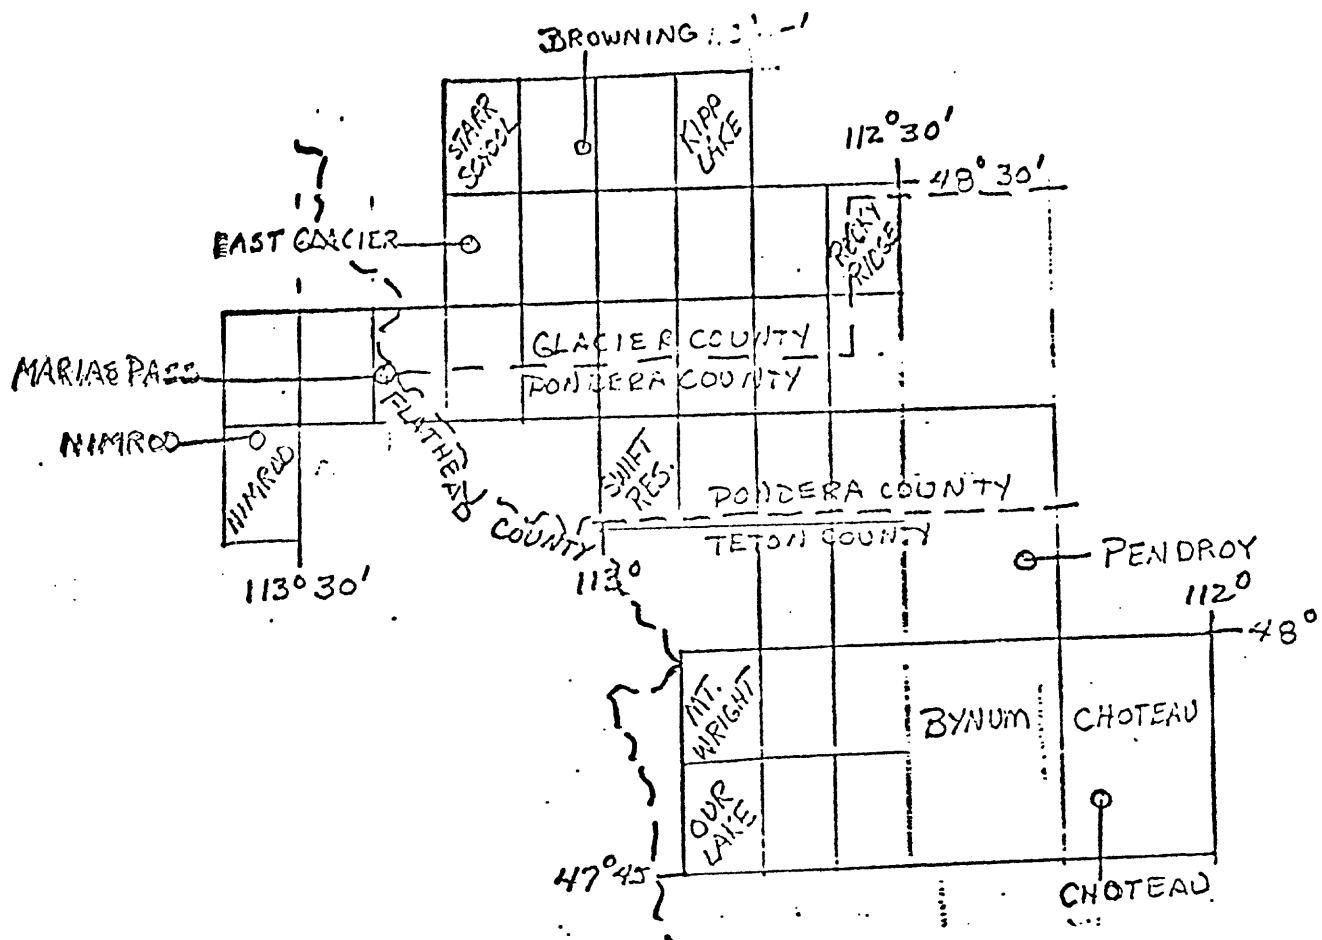

Figure 1. Area of gravity survey in Flathead, Glacier, Pondera and Teton Counties, Montana.

Creek Guest Ranch approximately six miles west of Marias Pass. It is tied to the gravity net base at East Glacier, Montana. The base station designated BELLBASE is located on the concrete porch of unit 17 at the Bella Vista Motel in Choteau, Montana, and was tied to the gravity net base at Choteau. The area covered by the survey is shown in Figure 1.

Station elevations were obtained from benchmarks, spot elevations, and contour interpolations on 1:24,000 scale topographic maps. Elevations are accurate to 1-2 m in areas of low relief, but may be in error by 5-10 m in more rugged terrain. The resultant error in Bouguer anomaly is less than 2 mgal.

Data Reduction

The gravity data were reduced by means of a digital computer program by G. I. Evenden and R. R. Wahl (unpub.). Gravity meter readings were converted to observed gravity using the International Gravity Standardization Net 1971 base values. The Geodetic Reference System 1967 formula (International Association of Geodesy, 1967) was used to compute theoretical gravity. The data were reduced to Bouguer anomaly values using an assumed average rock density of 2.67 gm/cm^3 . Terrain corrections were made by hand template through Zone H of Hammer (1939) and to 167 km by digital computer (Wahl, unpub.). The total computed corrections ranged from 0.04 mgal four miles northwest of Choteau to 16.19 mgal at Nimrod. Corrections were made for tidal effects and linear instrument drift.

The principal facts for the gravity stations are listed in Table 1.
Explanation of headings in Table 1:

STATION IDENTIFICATION	Gravity station number
LATITUDE	North latitude in degrees, minutes, and hundredths of minutes.

LONGITUDE	West longitude in degrees, minutes, and hundredths of minutes.
ELEV	Elevation in feet (to convert to meters, multiply by 0.3048).
ST	State where station is located (Montana).
OBSERVED GRAVITY	Observed gravity in milligals.
STD. GRAVITY	Theoretical gravity.
TERRAIN	Terrain correction in milligals.
FREE-AIR	Free-air anomaly in milligals.
BOUGUER	Elevation and curvature correction in milligals.
BOUGUER ANOMALY	Bouguer anomaly in milligals for assumed average density of 2.67 gm/cm^3 .
